

Panel 1

Complex Homework #20

① Without actually finding the series, find the radius of convergence for each Taylor series:

$$a) \frac{1}{3-z} = \sum_{n=0}^{\infty} a_n z^n \quad b) \frac{1}{(z+2i)(z-4)} = \sum_{n=0}^{\infty} a_n (z-1)^n$$

$$c) \frac{1}{e^z + 1} = \sum_{n=0}^{\infty} a_n z^n \quad d) \operatorname{Log}(z-i) = \sum_{n=0}^{\infty} a_n z^n$$

② Find Taylor series at the given center z_0 for:

$$a) f(z) = \sinh(z), z_0 = 0 \quad b) g(z) = z^5 e^{2z}, z_0 = 0$$

$$c) h(z) = \frac{z^3}{1+z^3}, z_0 = 0 \quad d) k(z) = \frac{1}{z-4}, z_0 = 2$$

Panel 2

③ Find the Laurent series centered at $z=0$, and list specifically the value of the coefficient $a_{-1} = \underline{\hspace{2cm}}$

$$a) f(z) = z^4 \sin\left(\frac{1}{z}\right) \quad b) g(z) = \frac{1}{z^4} \sin(z)$$

④ The function $f(z) = \frac{1}{3-z}$ has two series expansions, one for $|z| < 3$ and another for $|z| > 3$. Find them.

⑤ $f(z) = \frac{-2}{(z-1)(z-3)}$ has 3 series expansions. Find all three series and their domain of convergence (centered at $z_0 = 0$)

⑥ How many series expansions centered at $z_0 = 0$ does $f(z) = \frac{1}{e^z - 1}$ have, and where do they converge? →
